Ecological Nationalism as Profeminist Global Future Perspective

Assist. Prof. Dr. Mušić Lejla
Faculty of Political Sciences Sarajevo

ABSTRACT

The debate over the changes in climate system and greenhouse effect has reached its top during the transition from modern to postmodern age. The authors/ess argued that the ecological problems are more important than the national problems. Therefore the regionalization and formation of Unions formed in order to achieve better quality of life are necessary. Why should we accept the ecological nationalism idea? K. Sivaramakrishnan founded that ecological nationality represents the idea that is hard to be defined and his definition involves personal insight such as intersection of cosmopolitanism and nativism in devotion towards the nature. Barbara Adam, eminent sociologist developed the concept of global time, as time that involves web of people living in contemporary are to which the same ideas, news and inventions are transmitted at the same time. Globally, we can say that global time involves the society of contemporaries who share the same idea of the most important societal changes and inventions. Changes of climate are problems that had raised interest in all fields of human knowledge, biology, physics, sociology, philosophy, law, chemistry, politics etc. Environmentalist nationalism represents superior form of nationalism that is based on bioregionalism and together with an idea of cosmopolitan democracy, offers an alternative perspective for global future societies.
